

**AMENDMENTS TO THE CLAIMS:**

This listing of claims will replace all prior versions, and listings, of claims in the application:

1. (Currently Amended) An electroluminescence display device comprising:  
a substrate; and  
a plurality of pixels over the substrate, each of the plurality of pixels comprising:  
a first thin film transistor;  
a second thin film transistor comprising at least two thin film transistors ~~a gate electrode electrically connected to the first thin film transistor~~; and  
an electroluminescence element comprising an organic layer interposed between a pair of electrodes,  
wherein one of the pair of electrodes is electrically connected to the second thin film transistor, ~~and~~  
wherein the first thin film transistor comprises at least two channel regions in an active layer, at least two gate electrodes corresponding to the channel regions, over the active layer with a gate insulating film interposed therebetween, and an impurity region interposed between the channel regions, and [.]  
wherein at least the two thin film transistors and the electroluminescence element are connected in series.

2. (Currently Amended) An electroluminescence display device comprising:  
a substrate; and  
a plurality of pixels over the substrate, each of the plurality of pixels comprising:  
a first thin film transistor;  
a second thin film transistor comprising at least two thin film transistors ~~a gate electrode electrically connected to the first thin film transistor~~; and  
an electroluminescence element comprising an organic layer interposed between a pair of electrodes,  
wherein one of the pair of electrodes is electrically connected to the second thin film transistor,  
wherein the first thin film transistor comprises at least two channel regions in an active layer, at least two gate electrodes corresponding to the channel regions, over the active

layer with a gate insulating film interposed therebetween, and an impurity region interposed between the channel regions, ~~and~~

wherein a channel width of the second thin film transistor is greater than a channel width of the first thin film transistor, and [[.]]

wherein at least the two thin film transistors and the electroluminescence element are connected in series.

3. (Currently Amended) An electroluminescence display device comprising:

a substrate; and

a plurality of pixels over the substrate, each of the plurality of pixels comprising:

a first thin film transistor;

a second thin film transistor comprising at least two thin film transistors ~~a gate electrode electrically connected to the first thin film transistor;~~ and

an electroluminescence element comprising an organic layer interposed between a pair of electrodes,

wherein one of the pair of electrodes is electrically connected to the second thin film transistor,

wherein at least the first thin film transistor comprises an active layer in which two or more channel regions connected in series are formed, ~~and~~

wherein an equation of  $W2/L2 \geq 5 \times W1/L1$  is established where a channel length of the second thin film transistor is L2, a channel width of the second thin film transistor is W2, a sum of each of the channel lengths of the channel regions of the first thin film transistor is L1 and a channel width of the first thin film transistor is W1, and [[.]]

wherein at least the two thin film transistors and the electroluminescence element are connected in series.

4. (Previously Presented) An electroluminescence display device according to claim 3,

wherein the channel length of the second thin film transistor (L2) is 0.1 to 50  $\mu\text{m}$ , the channel width of the second thin film transistor (W2) is 0.5 to 30  $\mu\text{m}$ , the sum of each of the channel lengths of the channel regions of the first thin film transistor (L1) is 0.2 to 18  $\mu\text{m}$  and the channel width of the first thin film transistor (W1) is 0.1 to 5  $\mu\text{m}$ .

5. (Previously Presented) An electroluminescence display device according to claim 1,

wherein the first thin film transistor is a switching thin film transistor and the second thin film transistor is a current control thin film transistor.

6. (Previously Presented) An electroluminescence display device according to claim 2,

wherein the first thin film transistor is a switching thin film transistor and the second thin film transistor is a current control thin film transistor.

7. (Previously Presented) An electroluminescence display device according to claim 3,

wherein the first thin film transistor is a switching thin film transistor and the second thin film transistor is a current control thin film transistor.

8. (Previously Presented) An electroluminescence display device according to claim 1,

wherein each of the first and second thin film transistors has at least one lightly doped impurity region between a channel region and one of a drain region and the impurity region,

wherein the lightly doped impurity region of the first thin film transistor does not overlap the gate electrodes of the first thin film transistor, and

wherein the lightly doped impurity region of the second thin film transistor overlaps the gate electrode of the second thin film transistor at least partly.

9. (Previously Presented) An electroluminescence display device according to claim 2,

wherein each of the first and second thin film transistors has at least one lightly doped impurity region between a channel region and one of a drain region and the impurity region,

wherein the lightly doped impurity region of the first thin film transistor does not overlap the gate electrodes of the first thin film transistor and the lightly doped impurity

region of the second thin film transistor overlaps the gate electrode of the second thin film transistor at least partly.

10. (Previously Presented) An electroluminescence display device according to claim 3,

wherein each of the first and second thin film transistors has at least one lightly doped impurity region,

wherein the lightly doped impurity region of the first thin film transistor does not overlap a gate electrode of the first thin film transistor, and

wherein the lightly doped impurity region of the second thin film transistor overlaps the gate electrode of the second thin film transistor at least partly.

11-16. (Cancelled)

17. (Withdrawn-Previously Presented) An electroluminescence display device comprising:

a substrate; and

a plurality of pixels over the substrate, each of the plurality of pixels comprising:

a first thin film transistor;

a second thin film transistor comprising a gate electrode electrically connected to the first thin film transistor; and

an electroluminescence element comprising an organic layer interposed between a pair of electrodes,

wherein one of the pair of electrodes is electrically connected to the second thin film transistor,

wherein the first thin film transistor comprises at least two gate electrodes over the substrate, at least two channel regions corresponding to the gate electrode, over the gate electrode with a gate insulating film interposed therebetween, and an impurity region interposed between the channel regions, and

wherein the impurity region has the same impurity concentration as a source or drain region of the first thin film transistor.

18. (Withdrawn) An electroluminescence display device according to claim 17,  
a channel width of the second thin film transistor is greater than a channel width of  
the first thin film transistor.

19. (Withdrawn-Previously Presented) An electroluminescence display device  
according to claim 17,  
wherein each of the first and second thin film transistors has at least one lightly doped  
impurity region between a channel region and one of a drain region and the impurity region,  
wherein the lightly doped impurity region of the first thin film transistor does not  
overlap the gate electrodes of the first thin film transistor, and  
wherein the lightly doped impurity region of the second thin film transistor overlaps  
the gate electrode of the second thin film transistor at least partly.

20. (Withdrawn) An electroluminescence display device according to claim 17,  
wherein the first thin film transistor is a switching thin film transistor and the second  
thin film transistor is a current control thin film transistor.

21. (Withdrawn-Previously Presented) An electroluminescence display device  
according to claim 17,  
wherein an equation of  $W2/L2 \geq 5 \times W1/L1$  is established where a channel length of  
the second thin film transistor is  $L2$ , a channel width of the second thin film transistor is  $W2$ ,  
a sum of each of the channel lengths of the channel regions of the first thin film transistor is  
 $L1$  and a channel width of the first thin film transistor is  $W1$ .

22. (Withdrawn-Previously Presented) An electroluminescence display device  
according to claim 21,  
wherein the channel length of the second thin film transistor ( $L2$ ) is 0.1 to 50  $\mu\text{m}$ , the  
channel width of the second thin film transistor ( $W2$ ) is 0.5 to 30  $\mu\text{m}$ , the sum of each of the  
channel lengths of the channel regions of the first thin film transistor ( $L1$ ) is 0.2 to 18  $\mu\text{m}$  and  
the channel width of the first thin film transistor ( $W1$ ) is 0.1 to 5  $\mu\text{m}$ .

23. (Withdrawn) An electroluminescence display device according to claim 17, wherein the substrate comprises a material selected from the group consisting of a glass, a glass ceramic, a quartz, a silicon, a ceramic, a metal, and a plastic.

24. (Cancelled)

25. (Withdrawn-Previously Presented) An electroluminescence display device comprising:  
a substrate; and  
a plurality of pixels over the substrate, each of the plurality of pixels comprising:  
a first thin film transistor;  
a second thin film transistor comprising a gate electrode electrically connected to the first thin film transistor; and  
an electroluminescence element comprising an organic layer interposed between a pair of electrodes,  
wherein one of the pair of electrodes is electrically connected to the second thin film transistor,  
wherein the first thin film transistor comprises at least two gate electrodes over the substrate, at least two channel regions corresponding to the gate electrode, over the gate electrode with a gate insulating film interposed therebetween, and an impurity region interposed between the channel regions,  
wherein a channel width of the second thin film transistor is greater than a channel width of the first thin film transistor, and  
wherein the impurity region has the same impurity concentration as a source or drain region of the first thin film transistor.

26. (Withdrawn) An electroluminescence display device according to claim 25, wherein the first thin film transistor is a switching thin film transistor and the second thin film transistor is a current control thin film transistor.

27. (Withdrawn) An electroluminescence display device according to claim 25, wherein the substrate comprises a material selected from the group consisting of a glass, a glass ceramic, a quartz, a silicon, a ceramic, a metal, and a plastic.

28. (Canceled)

29. (Currently Amended) An electroluminescence display device comprising:  
a substrate; and  
a plurality of pixels over the substrate, each of the plurality of pixels comprising:  
a first thin film transistor;  
a second thin film transistor comprising at least two thin film transistors ~~a gate electrode electrically connected to the first thin film transistor~~; and  
an electroluminescence element comprising an organic layer interposed between a pair of electrodes,  
wherein one of the pair of electrodes is electrically connected to the second thin film transistor,  
wherein the first thin film transistor comprises an active layer in which at least two channel regions connected in series are formed with an impurity region interposed therebetween,  
wherein each of the first and second thin film transistors has at least one lightly doped impurity region between a channel region and one of a drain region and the impurity region,  
wherein the lightly doped impurity region of the first thin film transistor does not overlap a gate electrode of the first thin film transistor, ~~and~~  
wherein the lightly doped impurity region of the second thin film transistor overlaps the gate electrode of the second thin film transistor at least partly, and [[.]]  
wherein at least the two thin film transistors and the electroluminescence element are connected in series.

30. (Previously Presented) An electroluminescence display device according to claim 29,

wherein the first thin film transistor is a switching thin film transistor and the second thin film transistor is a current control thin film transistor.

31. (Previously Presented) An electroluminescence display device according to claim 29,

wherein the substrate comprises a material selected from the group consisting of a glass, a glass ceramic, a quartz, a silicon, a ceramic, a metal, and a plastic.

32. (Canceled)

33. (Currently Amended) An electroluminescence display device comprising:

a substrate; and

a plurality of pixels over the substrate, each of the plurality of pixels comprising:

a switching element comprising an active layer and at least first and second gate electrodes adjacent to the active layer with a gate insulating film interposed therebetween;

a current control element comprising at least two thin film transistors ~~a gate electrode electrically connected to the switching element~~; and

an electroluminescence element comprising an organic layer interposed between a pair of electrodes,

wherein one of the pair of electrodes is electrically connected to the current control element, and ~~[[.]]~~

wherein at least the two thin film transistors and the electroluminescence element are connected in series.

34. (Previously Presented) An electroluminescence display device according to claim 33,

a channel width of the current control element is greater than a channel width of the switching element.

35. (Previously Presented) An electroluminescence display device according to claim 33,

wherein each of the switching element and current control element has at least one lightly doped impurity region,

wherein the lightly doped impurity region of the switching element does not overlap the first and second gate electrodes of the switching element, and

wherein the lightly doped impurity region of the current control element overlaps the gate electrode of the current control element at least partly.

36. (Previously Presented) An electroluminescence display device according to claim 33,

wherein the substrate comprises a material selected from the group consisting of a glass, a glass ceramic, a quartz, a silicon, a ceramic, a metal, and a plastic.

37. (Cancelled)

38. (Currently Amended) An electroluminescence display device comprising:

a substrate; and

a plurality of pixels over the substrate, each of the plurality of pixels comprising:

a switching element comprising an active layer and at least first and second gate electrodes adjacent to the active layer with a gate insulating film interposed therebetween;

a current control element comprising at least two thin film transistors ~~a gate electrode electrically connected to the switching element~~; and

an electroluminescence element comprising an organic layer interposed between a pair of electrodes,

wherein one of the pair of electrodes is electrically connected to the current control element, ~~and~~

wherein a channel width of the current control element is greater than a channel width of the switching element, and [.]

wherein at least the two thin film transistors and the electroluminescence element are connected in series.

39. (Previously Presented) An electroluminescence display device according to claim 38,

wherein the substrate comprises a material selected from the group consisting of a glass, a glass ceramic, a quartz, a silicon, a ceramic, a metal, and a plastic.

40. (Cancelled)

41. (Currently Amended) An electroluminescence display device comprising:

a substrate; and

a plurality of pixels over the substrate, each of the plurality of pixels comprising:

a switching element comprising an active layer and at least first and second gate electrodes adjacent to the active layer with a gate insulating film interposed therebetween;

a current control element comprising at least two thin film transistors ~~a gate electrode electrically connected to the switching element~~; and

an electroluminescence element comprising an organic layer interposed between a pair of electrodes,

wherein one of the pair of electrodes is electrically connected to the current control element,

wherein each of the switching element and the current control element has at least one lightly doped impurity region,

wherein the lightly doped impurity region of the switching element does not overlap the first and second gate electrodes of the switching element, ~~and~~

wherein the lightly doped impurity region of the current control element overlaps the gate electrode of the current control element at least partly, and ~~[[.]]~~

wherein at least the two thin film transistors and the electroluminescence element are connected in series.

42. (Previously Presented) An electroluminescence display device according to claim 41,

wherein the substrate comprises a material selected from the group consisting of a glass, a glass ceramic, a quartz, a silicon, a ceramic, a metal, and a plastic.

43. (Canceled)

44. (Currently Amended) An electroluminescence display device comprising:  
a substrate; and  
a plurality of pixels over the substrate, each of the plurality of pixels comprising:  
a switching element comprising at least two thin film transistors;  
a current control element comprising at least two thin film transistors ~~a gate electrode electrically connected to the switching element~~; and  
an electroluminescence element comprising an organic layer interposed between a pair of electrodes,  
wherein one of the pair of electrodes is electrically connected to the current control element, and ~~[[.]]~~  
wherein at least the two thin film transistors and the electroluminescence element are connected in series.

45. (Previously Presented) An electroluminescence display device according to claim 44,  
a channel width of the current control element is greater than a channel width of the switching element.

46. (Previously Presented) An electroluminescence display device according to claim 44,  
wherein each of the switching element and the current control element has at least one lightly doped impurity region,  
wherein the lightly doped impurity region of the switching element does not overlap a gate electrode of the switching element, and  
wherein the lightly doped impurity region of the current control element overlaps the gate electrode of the current control element at least partly.

47. (Previously Presented) An electroluminescence display device according to claim 44,

wherein the substrate comprises a material selected from the group consisting of a glass, a glass ceramic, a quartz, a silicon, a ceramic, a metal, and a plastic.

48. (Canceled).

49. (Currently Amended) An electroluminescence display device comprising:

a substrate; and

a plurality of pixels over the substrate, each of the plurality of pixels comprising:

a switching element comprising at least two thin film transistors;

a current control element comprising at least two thin film transistors ~~a gate electrode electrically connected to the switching element~~; and

an electroluminescence element comprising an organic layer interposed between a pair of electrodes,

wherein one of the pair of electrodes is electrically connected to the current control element, ~~and~~

wherein a channel width of the current control element is greater than a channel width of the switching element, and [[.]]

wherein at least the two thin film transistors and the electroluminescence element are connected in series.

50. (Previously Presented) An electroluminescence display device according to claim 49,

wherein the substrate comprises a material selected from the group consisting of a glass, a glass ceramic, a quartz, a silicon, a ceramic, a metal, and a plastic.

51. (Canceled)

52. (Currently Amended) An electroluminescence display device comprising:

a substrate; and

a plurality of pixels over the substrate, each of the plurality of pixels comprising:

a switching element comprising at least two thin film transistors;  
a current control element comprising at least two thin film transistors ~~a gate electrode electrically connected to the switching element~~; and  
an electroluminescence element comprising an organic layer interposed between a pair of electrodes,  
wherein one of the pair of electrodes is electrically connected to the current control element,  
wherein each of the switching element and the current control element has at least one lightly doped impurity region,  
wherein the lightly doped impurity region of the switching element does not overlap gate electrodes of the switching element, ~~and~~  
wherein the lightly doped impurity region of the current control element overlaps the gate electrode of the current control element at least partly, and [[.]]  
wherein at least the two thin film transistors and the electroluminescence element are connected in series.

53. (Previously Presented) An electroluminescence display device according to claim 52,

wherein the substrate comprises a material selected from the group consisting of a glass, a glass ceramic, a quartz, a silicon, a ceramic, a metal, and a plastic.

54. (Canceled)

55. (Previously Presented) An electroluminescence display device according to claim 1,

wherein a top surface of the impurity region is entirely in contact with the gate insulating film.

56. (Previously Presented) An electroluminescence display device according to claim 2,

wherein a top surface of the impurity region is entirely in contact with the gate insulating film.

57. (Previously Presented) An electroluminescence display device according to claim 3,

wherein, in a region between the channel regions, a top surface of the active layer is entirely in contact with a gate insulating film.

58. (Previously Presented) An electroluminescence display device according to claim 29,

wherein a top surface of the impurity region is entirely in contact with a gate insulating film.

59. (Previously Presented) An electroluminescence display device according to claim 33,

wherein, in a region between the first gate electrode and the second gate electrode, a top surface of the active layer is entirely in contact with the gate insulating film.

60. (Previously Presented) An electroluminescence display device according to claim 38,

wherein, in a region between the first gate electrode and the second gate electrode, a top surface of the active layer is entirely in contact with the gate insulating film.

61. (Previously Presented) An electroluminescence display device according to claim 41,

wherein, in a region between the first gate electrode and the second gate electrode, a top surface of the active layer is entirely in contact with the gate insulating film.

62. (Previously Presented) An electroluminescence display device according to claim 44,

wherein each of the thin film transistors of the switching element comprises a gate electrode and an active layer with a gate insulating film therebetween, and

wherein, in a region between the gate electrodes of the thin film transistors of the switching element, a top surface of the active layer is entirely in contact with the gate insulating film.

63. (Previously Presented) An electroluminescence display device according to claim 49,

wherein each of the thin film transistors of the switching element comprises a gate electrode and an active layer with a gate insulating film therebetween, and

wherein, in a region between the gate electrodes of the thin film transistors of the switching element, a top surface of the active layer is entirely in contact with the gate insulating film.

64. (Previously Presented) An electroluminescence display device according to claim 52,

wherein each of the thin film transistors of the switching element comprises an active layer with a gate insulating film between the gate electrodes and the active layer, and

wherein, in a region between the gate electrodes of the thin film transistors of the switching element, a top surface of the active layer is entirely in contact with the gate insulating film.
